

Commands to Setup React + Redux + Axios

Option 1 (Recommended): Use Redux Template

This sets up a new React app with Redux already installed.

```
Shell
npx create-react-app my-app --template redux
cd my-app
npm install axios
```

Ideally, `--template redux` should install all the dependencies but if it doesn't follow

Option 2: If Template Misses Dependencies

Sometimes `--template redux` may skip installing required packages. If you see errors like *"Cannot resolve @reduxjs/toolkit or react-redux"*, run:

```
Shell
npm install @reduxjs/toolkit react-redux
npm install web-vitals
```

`@reduxjs/toolkit` - to create slices, thunks, store
`react-redux` - to connect Redux with React components
`axios` - to make API calls
